## # Set Vision And Goal

(Self belief)

You are On Right Path

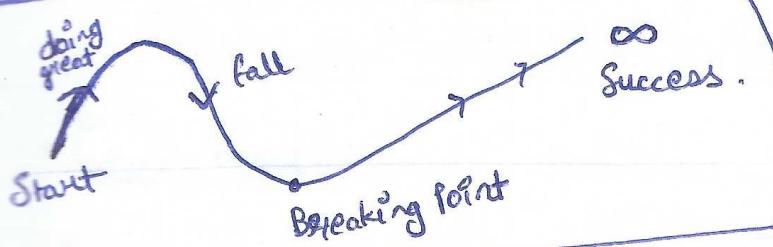

- ↳ Coding will take time
  - ↳ Long term plans
- Good results take time

## # Solve your own problem.

### # Too much theory Less practice

Avoid this

Self Practice

Path

1 Sem

- Language ①
- DSA ②
- Practice (300-400) Qs ③
- Competitive Programming ④
- Development

Sem

- ↳ Build Project (real life solving)

↳ Build Resume

- ↳ 2nd yr Internship
- ↳ Open Source

↳ Find Your Niche

## • Tips -

Day 1 → Learn (Afternoon)

Day 2 → Practice (Afternoon)

Once Start

No stop

• Detailed notes from Averages

• Practice each question.

• College subject make perfect only till you get good marks in exam.

↳ This course has everything that a tier 1 college has.

↳

## \* Some important functions

① swap(nums, i, j); for nums[];

② arr ←

③ arr[0-0] = 0; position ←

④ [ ] primary addition

triangle ( )

arr[0] = 0; for i=0 to n-1

small block ( )

where ( )

without ( )

and ( )

different ( )

# # Flowcharts → Diagram to represent solution of problem.

- ↳ ① Divide the work in small parts.
- ② Logically solve the small parts.

Ex- Making of tea → Start.

bowl the water

gas stove on

Sugar, tea, leaves, milk

Boil

Exit

name = Value

Assignment operator

Variable

## 4) Decision -

And these all shapes are connected with

(various) →, ↓

## Example of Problem

### Sum of two Numbers

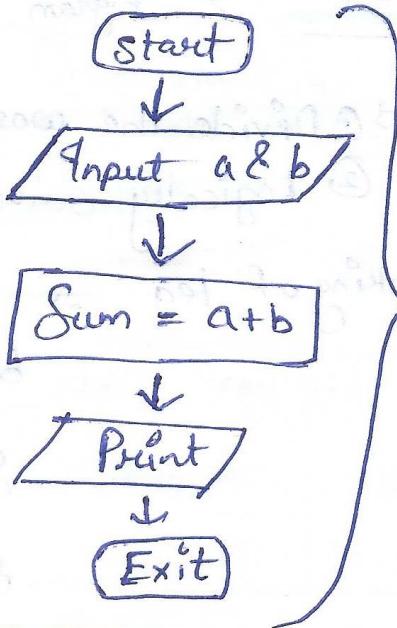

Input

first no., a

Second no., b

Output

Sum of a & b

### Calculate Simple Interest

Input

- Principal, P
- Rate, R
- Time, T

Multiplication sign in Java  $\rightarrow *$

Output

$$SI = \frac{PRT}{100}$$

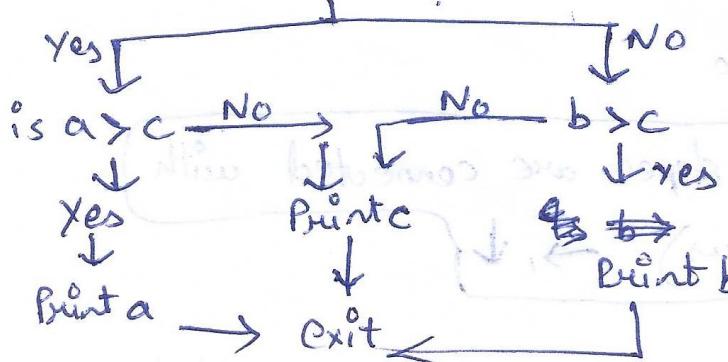

Formulas may not  
be reminding  
be reminding  
that's not a problem.

### Pseudo Code

- 1) Start
  - 2) Input principals (P)  
Rate (R)  
Time (T)
  - 3) Calculate
  - 4) Print SI (Simple Interest)
  - 5) Exit
- $$SI = (P * R * T) / 100$$

### Find max of 3 numbers ?

- 1) Input a, b, c
- 2) Is  $a > b$  ?

See what your brain think

### Pseudo code

- 1) Start
- 2) Input a, b, c
- 3) If  $a > b$  do
  - if  $a > c$  do
    - Print a
  - else Print c
- else if  $b > c$  do
  - Print b
- else Print c

Q Find the number is prime or not?

⇒ Pseudo code

- 1) Start
- 2) Input no.  $n$
- 3) While  $\text{div} < n$  do
  - 4) If  $n \% \text{div} == 0$  do
    - Print "Not prime"
    - Exit
  - Else  $\text{div} = \text{div} + 1$
- 5) Print Prime
- 6) Exit

### Non prime Numbers

↳ Can be divide by  
the no. bet<sup>n</sup>

$$2 \longleftrightarrow (n-1)$$

↳ ex - 6

$$2 \longleftrightarrow (6-1)$$

→ Six can be divided  
by 2,3

∴ It is not a prime

Q Sum of first  $n$  natural Numbers?

⇒ Pseudo code

$$\boxed{n * (n+1) / 2}$$

- 1) Start
- 2) Input no.  $n$

$$3) \text{if } n * (n+1) / 2 = a \text{ then}$$

- 4) Print  $a$

- 5) exit

# Sum of 25 scores? (Average)

⇒ 1)  $\text{sum} = 0, \text{count} = 0$

2) Enter  $s$ .

3)  $\text{sum} = \text{sum} + s$

4)  $\text{count} = \text{count} + 1$

5) If  $\text{count} = 25$

6)  $\text{Av sum} / 25$

To check remainder  
in java

$$a \% b = [ ] \leftarrow$$

If it  
equal to 0

- 1) Start

- 2) Input  $n$

- 3) Let value = 1, sum = 0

- 4) While  $\text{value} < n$  do

    Sum = Sum + Value

    Value = Value + 1

- 5) Print

- 6) Exit

# If in question asked no. bet<sup>n</sup> 9 and 100 then  
the no. are  $\Rightarrow 10, \dots, 98$

# Solution can be found by formulae or  
human use.

# # Variables and Data Types

~~class~~

• Name of our file and public class  
should always be same - for example

ex -

JavaBasics.java

Public class JavaBasics

# Compiler finds the main program first

• Basic first line of java code...

```
1 public class (name of program) {  
2     Public static void main {String args []} {  
3         [All other code is written here]  
4     }  
5 }
```

// Boiler plate code

## # Out put in Java

System.out.print("Hello World")  
↓  
function

String

;

Terminator

! System → S should be capital

In → next line

! OUT → O should be small

or

! print → P should be small

```
{"Hello\n"}
```

## # Print Pattern

\*\*\* ← output

\*\*

\*\*

\*

⇒ System.out.println(" \*\*\* "); ← input  
System.out.println(" \*\* ");  
System.out.println(" \* ");  
System.out.println("\*");

## # Output in Java

statement terminator.

System.out.print("Hello World");

↓  
function

## # Variables in Java

2 \* (a+b)

↓  
Literal

variables

- Literal → which have fixed values.

ex - 2, 3, Character a, b, c etc.

- Variables → which can change

↳ It's a memory in which something is stored.

## # Data types in Java

Java is a typed language

↳ Here we need to specify int, float

### Primitive

- byte
- short
- char
- boolean
- int
- long
- float
- double

### Non-Primitive

- String
- Array
- Class
- Object
- Interface

## 1) byte

Size - 1 byte

↳ In this value can be stored

ex - byte b = 8;

↳ print  $\Rightarrow$  8

↳ types can be stored (-128 to 127)

## 2) char

Size - 2 byte

['a' to 'z', 'A' to 'Z', symbols]

↳ ex -

char ch = a;

↳ single character can be stored

## 3) boolean

Size  $\rightarrow$  1 byte

(true/false)

↳ Only two values

True / False

ex -

boolean var = false;

## 4) float

Size - 4 byte

↳ Decimal number can be stored

ex -

float price = 10.5;

## 5) int

(-2 billion, 2 billion)

Size - 4 bytes

↳ If we want to store a integer

ex -

int number = 25;

## 6) long $\rightarrow$ A number of integer

8 byte

## 7) double $\rightarrow$ A long number of ~~integer~~ a decimal number

size - 8 byte

## 8) short

Size  $\rightarrow$  2 byte

↳ 1 number can be stored

ex -

short n = 240;

Question - Sum of a + b

$\Rightarrow$  int a = 10;

int b = 5;

int sum = a + b

• Keep the name of variable Logical

## # Comments in Java

↳ statements that does not execute in java

1) // it will be ignored } single line comment

2) /\*

      \*/     } Multiline Comment

↳ Compiler ignores.

## # Input in Java

```
import java.util.*;  
Scanner sc = new Scanner(System.in)
```

String input = sc.next();  
    ↑  
    variable

• Make a class

Scanner

• util is a package

This next captures  
till only next 'space'  
in input

• nextLine → captures till next line

# For taking input of a number?

⇒ int number = sc.nextInt();

System.out.println(number);

• For floating value?

⇒ float price = sc.nextFloat();

System.out.println(price);

• And more methods

→ nextByte

→ For byte type data

→ nextDouble

→ nextBoolean

→ nextShort

→ nextLong

## # Sum of a and b (By taking input)

### Question

Scanner →

```
int a = sc.nextInt();  
int b = sc.nextInt();  
int sum = a+b;  
System.out.println(sum);
```

Program in PC

### Question

## # Multiplication of a and b

```
int a = sc.nextInt();  
int b = sc.nextInt();  
int product = a*b;
```

Program  
in PC

```
System.out.println(product);
```

### Question

## # Area of circle

Scanner

```
int r = sc.nextInt();  
int d = sc.nextInt();
```

Program in PC

```
float area = 3.14 * r * r
```

```
System.out.println(area);
```

\* If we add a (f) with out decimal value it becomes floating number.

Example → 3.14f

And if not then it will be a double

## # Type Conversion / Widening / implicit conversion

↳ happen only bet<sup>n</sup> compatible types

**byte → short → int → float → long → double**

↳ and the <sup>type</sup> should be greater than the type that is converted.

## # Type Casting / Narrowing conversion / explicit

→ Force full type conversion

float a = 25.99

int b = (int)a;

System.out.println(b);

Output

= 25

Character can also be converted into number

a = 97

b = 98

c = 99

d = 100

## # Type Promotion in expression

↳ Java automatically promotes

**byte, short or char → Int**

when evaluating an expression.

# and when  
int, float, long, double  
are written together  
it get converted  
into double

**int, float, long → double**

Ex -

char a = 'a';

char b = 'b';

System.out.println((int)(a));

System.out.println((int)(b));

System.out.println=(b-a);

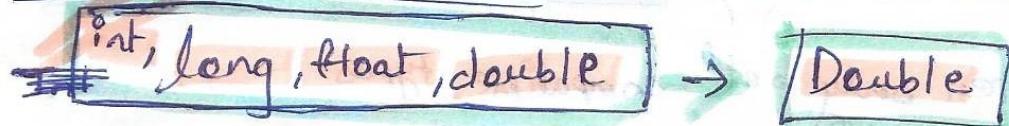

Output

97

⇒ 98

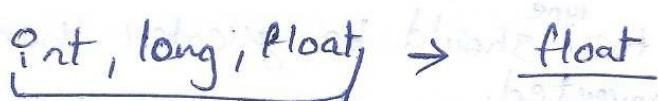

1

- During expression. Automatic conversion by java

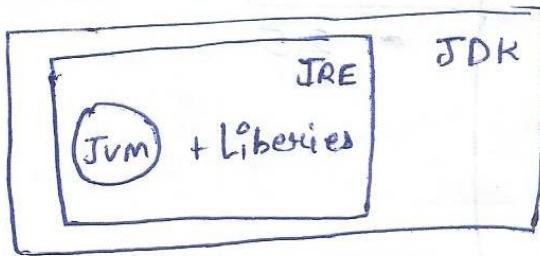

Its get converted into the greatest one

Ex -

## # How is our code is running?

JRE → Java runtime environment

Source code (.Java)

Compiler

Byte Code  
.class

Java Virtual Machine  
(JVM)

Native Code

• Java is a portable language

C++ is not

\* Identifiers can start with any variable

including (-) and ~~( \$ )~~.

String

RP

RP

RP

i = a + b

j = b + a

i + j = a + b

i - j = a - b

j - i = b - a

# # Operators in Java

add  $\rightarrow +$

Subtract  $\rightarrow -$

Multiply  $\rightarrow *$

divide  $\rightarrow /$

operands  
operator  
expression

$$\text{Sum} = a+b$$

## # Types of operators

### 1) Arithmetic operators

#### Binary (2 operands)

- $\rightarrow A+B$
- $\rightarrow A-B$
- $\rightarrow A*B$
- $\rightarrow A/B$

(Modulo)  $\% \rightarrow A\%$

For remainder

ex -  $10 \% 5 = 2$

ex - `int a = 10;`

`int b =`

#### Unary (Increment)

- $a = a+1 \rightarrow a++ \text{ or } ++a$
- $a = a-1 \rightarrow a-- \text{ or } --a$

#### (Decrement)

`# ++a`  $\rightarrow$  Pre Increment

- First value changed
- then it is used

`# a++`  $\rightarrow$  Post increment

- First it is used
- then value is increased.

### 2) Relational Operators

- $\text{==}$  To check values are equal or not

ex -  $a=b \rightarrow \text{False}$

`(5) (10)`

We get result as ~~True~~ True and False

- $\text{!=}$  not equal to

$>$  Smaller than

$<$  greater than

$\geq$  less than equal to

$\leq$  greater than equal to

### 3) Logical Operators

True  $\rightarrow T$

False  $\rightarrow F$

#### i) Logical AND $\Rightarrow \&&$

True  $\&&$  True  $\rightarrow T$

F  $\&&$  F  $\rightarrow F$

T  $\&&$  F  $\rightarrow F$

F  $\&&$  T  $\rightarrow T$

#### ii) Logical OR $\Rightarrow \mid\mid$

T  $\mid\mid$  F  $\rightarrow T$

F  $\mid\mid$  T  $\rightarrow T$

F  $\mid\mid$  F  $\rightarrow F$

T  $\mid\mid$  T  $= T$

#### iii) Logical NOT $\Rightarrow !$

!T  $\rightarrow F$

!F  $\rightarrow T$

### 4) Assignment Operator

\* These are faster than normal operators

i)  $=$  ex -  $A = B$

ii)  $+=$  ex -  $A = A + 10 \rightarrow A+ = 10$

iii)  $-=$  ex -  $A = A - 10 \rightarrow A- = 10$

iv)  $*=$  ex -  $A = A * 2 \rightarrow A* = 2$

v)  $/=$  ex -  $A = A / 2 \rightarrow A/ = 2$

## Operator Precedence → which will execute first.

ex- int  $x = 3 * 4 - 1$

→ Here  $x = 11$   
not 9.

- 1)  ~~$\boxed{*} > \boxed{-}$~~  →  ~~$\boxed{+} <= \boxed{-}$~~  )  $\boxed{++} > \boxed{-}$
- 2)  ~~$\boxed{*} > \boxed{-}$~~  →  ~~$\boxed{+} > \boxed{-}$~~  →  ~~$\boxed{+} > \boxed{-}$~~  Left to right
- 3)  ~~$\boxed{*} > \boxed{/} > \boxed{\%}$~~

4)  $\boxed{+} > \boxed{-}$

5)  $\boxed{<<} > \boxed{>>} > \boxed{>>>}$

6)  $\boxed{<} > \boxed{<} > \boxed{<=} > \boxed{>} > \boxed{>=}$  instance of

7)  $\boxed{==} > \boxed{!=}$

8)  $\boxed{>>=} > \boxed{>=} > \boxed{<<=} > \boxed{!=} > \boxed{^=} > \boxed{&=} > \boxed{|=} > \boxed{*=}$

in a line have same precedence

• If in a line have same precedence  
the expression is evaluated to according  
to its associativity (either left → right or  
right → left)

• change is w

return parent

Notation

if true then {statement} ; {statement} = always

Start with 316

= global 311

= global 119

i := 3 ? (i < 3) = repeat condition

i ← 3

"abs" : "new" \$(o == 10^3) = sqrt point

# # Conditional Statements

1) if - else Statements :  $\Rightarrow \text{if}(\text{condition})\{\dots\}$

i) Program  $\rightarrow$  Print largest numbers.

ii) Program  $\rightarrow$  Print number is odd or even.

else {

2) else if Statements.

$\Rightarrow \text{if}(\text{condition}1)\{\dots\}$

• Parenthesis  $\rightarrow ()$

• Curly braces  $\rightarrow \{\}$

else if (condition<sup>2</sup>) {

i) Program  $\rightarrow$  Print largest of ~~the~~ three numbers.

else {

}

## # Ternary Operator

$\hookrightarrow$  3 operands.

variable = condition ? Statement 1 : Statement 2 ;

Nah toh

true

if this is true  
the variable = 1 ;

or variable = 2 ;

Ex -

boolean larger = ( $5 > 3$ ) ? 5 : 3 ;

Output  $\Rightarrow$  5

Ex -

String type = ( $5 \% 2 == 0$ ) ? "even" : "odd" ;

Program → student will pass or fail?

## Switch Statement

```
switch (variable) {  
    case case 1:  
        // code  
    case 2:  
        // code  
    case 3:  
        // code  
        break;  
    default:  
        // code  
}
```

↳ If variable is 1 case one will execute.

↳ If no case is true default execute.

To break the switch.

↳ It can be written after any case to break switch from there.

↳ You can either use int for variable or char or float etc.

## Program - Calculator

# Leap year or not?

→ If the year is divisible by -

4 and 100 → Leap year

4 and 400 → Leap year.

108 BY

10801 in

for tipib tool two shot of a  
old fi shivib medium

to tel ei rebinishe bren

## # Loops (Flow control)

### 1) while Loop :-

```
while (condition){
```

```
//do something  
}
```

Q. Print no. from 1 to 10 ?

Q. Print sum of 1(n) natural no.?

### 2) for Loop :-

```
for (initialisation; condition; updation){
```

```
//do something  
}
```

```
for (int i=1; i<=10; i++)
```

```
{ System.out.println("Hello world!");  
}
```

Q. Print square pattern?

## # Print Reverse of a number

ex    n = 10899    → 99801

- To take out last digit of any number divide it by 10 and remainder is last digit

To take out last digit  $\rightarrow$   $\text{Num} \% 10$

To ~~remove~~ remove last digit  $\rightarrow$   $\text{Num}/10$

Take out the reverse of given number.

$\Rightarrow \text{while}(a > 0) \{$

$$\text{lastdigit} = (a \% 10);$$

$$\text{rev} = (\text{rev} \times 10) + \text{lastdigit}$$

## do-while loop

do {

// do something

} while(condition);

## Break Statement

break;

$\hookrightarrow$  to get out from a loop.

Q. Break statement when user enters multiple of 10?

{ { i(\*) } if you need to keep the loop running  
add condition are true. }

## Continue Statement

continue;

$\hookrightarrow$  To skip an iteration.

Q. Display all numbers but not multiple of 10.

Q. Check the no. is prime or not?

\* If any variable written inside the loop it is only valid inside the loop. Not in the whole program.

## # Nested Loops

1) Print star pattern ?

x  
xx  
xxx  
xxxx

→ ① lines (4)

↳ outer loop → 4 times

② Number of Times

↳ inner loop

If we i<sup>th</sup> line  
then its i times.

→ for (int line = 1; line <= 4; line++) {  
    for (int star = 1; star <= line; star++) {  
        System.out.print("\*");  
    }  
}

③ What to print?

→ " \* "

2) Inverted star pattern ?

xxxx  
xxx  
xx  
x

→ for (int line = 1; line <= 4; line++)

{ for (int star = 1; star = 4 - line; star++)

{ System.out.print("\*"); } }

3) Half pyramid pattern ?

1  
1 2  
1 2 3  
1 2 3 4

Character is initialized using single quotation.

ex- `char = 'A';`

## Functions

↳ A block of code  
(reserved name of function)

↳ `public static void main(String args [])`

↳ return type → empty

↳ name → `main`

↳ arguments → `String args []`

↳ body → `System.out.println("Hello")`

↳ returnType<sup>name</sup> () {  
    // body  
    return statement;  
}

\* making a new function to print ~~Hello~~ world!

↳ `public static void printHelloWorld()` {  
    return type → empty  
    name → `printHelloWorld`  
    arguments → `String args []`  
    body → `System.out.println("Hello")`

To call a function.

↳ `public static void main(String args []) {  
    printHelloWorld();  
}`

• We also need to write return  
but If our type is void No need to  
write return.

Methods → Function that we write inside the class.

## o Functions with parameters.

~~return Type name~~

↳ return Type name (type param<sub>1</sub>, type param<sub>2</sub>);  
    //body  
    return statement;  
}

↳ In parameters we have to show which input we have taken

ex- int a, int b.

4) Two functions can have same name for a variable but they both have different work.

## o Functions with parameters.

Parameters.

Ex- public static int sum1 (int num1, int num2) {

    int sum = num1 + num2;  
    return sum;

    public static void main (String args[]) {

        Scanner sc = new Scanner (System.in);

        Scanner int a = sc.nextInt();

        - b = - ;

        int sum = sum1 (a, b);

Arguments

        System.out.println (sum);

Formal parameters  
(Parameters)

Actual parameters  
(Arguments)

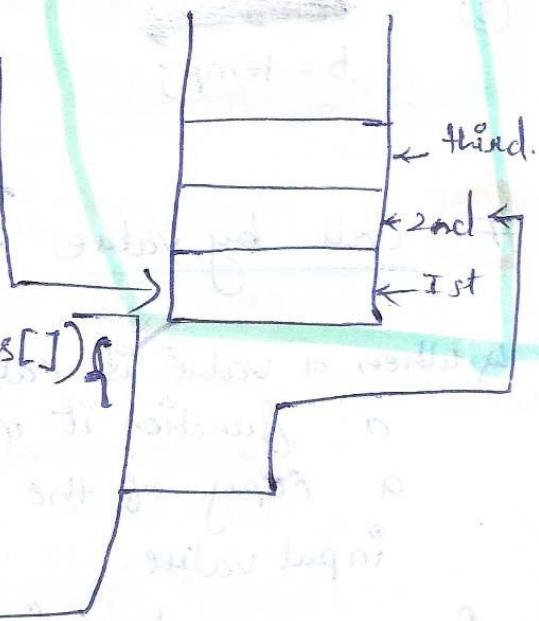

↳ During definition of function

↳ During Calling of function.

= What happens in memory?

→ Public static int sum1(...){  
int a=...;  
int b=...;  
return sum;

Call Stack

It will occupies the memory

Public static void main(String args[]){  
Scanner s = ...;  
int a = ...;  
int b = ...;  
sum = sum1(a, b);

It will occupies the memory over the first

As the program executes in main function memory

↳ Values of int a and b is saved

In function sum1

↳ sum of a and b is stored

After return function.

↳ the value is returned to main function

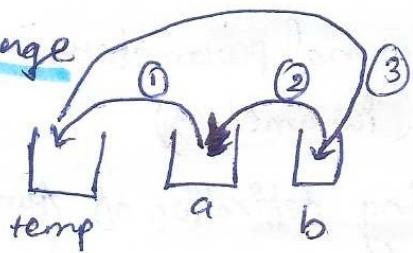

Now the sum1 function memory will be deleted (empty)

And after output

↳ main function memory will be deleted.

## # Swap the values / Exchange

⇒  
int a = 10  
int b = 5

//swap

- (1) int temp = a;
- (2) a = b;
- (3) ~~b = temp;~~

Used in Java

## # Call by value → A copy of input value is used in all the functions.

↳ When a value is called in a function it makes a copy of the original input value.

So if return is executed the stack get deleted of that function.

## # Call by Reference → original value is passed in the function

↳ Used in C++

### Question

① Find product of a & b?

② Find factorial of a number?

③ Binomial coefficient  $C_n = \frac{n!}{r!(n-r)!}$

For using square root Use Math Class

⇒ **Math.sqrt()**

- Inbuilt methods vs. User defined methods
- ↳ Already made
  - ex → `sc.nextInt()`
  - ↳ Manually written

## Function Overloading

- ↳ We can have multiple ~~function~~ functions with same name and with different parameters
- ↳ Difference in that functions
  - type of parameters.
  - ~~No. of parameters.~~

↳ It only works when only parameters are different

### Function overloading using parameters

- Q → Function overloading using parameters?
- Q → Function overloading using Data types?
- Q → Check a number is prime or not?

↳ Optimised method.

```
public static boolean prime(int n) {
    for (i=2; i<sqrt(n); i++) {
        if (n%i==0) {
            return false;
        }
    }
}
```

else { return true; }

Add 2 as an exception.

- Q → Check prime or not - optimised

Q. Print all the numbers that are prime in the range?

## # Convert from Binary to Decimal

- Decimal number system  $\rightarrow 1, 2, 3, 4, 5, 6, 7, 8, 9$
- Binary number system  $\rightarrow [1, 2]$

<u>Decimal</u>	<u>Binary</u>
$(0)_{10}$	$(0)_2$
$(1)_{10}$	$(01)_2$
$(2)_{10}$	$(10)_2$
$(3)_{10}$	$(11)_2$
$(4)_{10}$	$(100)_2$
$(5)_{10}$	$(101)_2$
$(6)_{10}$	$(110)_2$
$(7)_{10}$	$(111)_2$
$(8)_{10}$	$(1000)_2$

$B \rightarrow D$

ex - 101

↑x ↑x ↑x

$2^2 + 2^1 + 2^0$

$\Rightarrow 4 + 0 + 1 = 5$

Code.  $\rightarrow$  ex - 1010

~~int pow = 0, pow++;~~

~~int lastDigit = n % 10;~~

~~LastDigit = 1~~

~~dec = 0~~

$dec = dec + [lastDigit * 2^{pow}]$

\*  $\text{Math.pow}(a, b) \Rightarrow a^b$

$\Rightarrow$  PseudoCode

```
int pow = 0
int deciNum = 0
(Num1){
```

while (Num1 > 0) {

int lastDigit = Num1 % 10;

deciNum = deciNum + (lastDigit \* (int) Math.Pow(2, Pow));

Num1 = Num1 / 10; }

Pow++;

Q. Convert binary  $\rightarrow$  Decimal

## Convert Decimal to Binary

Ex - 7

$$\begin{array}{r} 2 \\ \hline 7 \\ 2 \\ \hline 3 \\ 2 \\ \hline 1 \\ 2 \\ \hline 0 \end{array}$$

Quotient

Remainder  $\rightarrow 111$

$$B \quad (7)_0 \rightarrow (111)_2$$

Ex - 8

$$\begin{array}{r} 2 \\ \hline 8 \\ 2 \\ \hline 4 \\ 2 \\ \hline 2 \\ 2 \\ \hline 1 \\ 2 \\ \hline \end{array}$$

Remainder  
1000

$$8 \rightarrow 1000$$

int pow = 0;  
int binNum = 0;  
while (num > 0) {

binNum = binNum

binNum = binNum + (binNum % 2) \* (int) Math.pow(10, pow);

pow++;

num = num / 2; }

System.out.println(binNum);

while (n > 0) {

① divide by 2

↳ rem

② bin = bin + rem \* pow

Q. Convert Decimal to binary?

Scope  $\rightarrow$  If we made a variable then

class scope { }

where where we can use that variable.

Method Scope  $\rightarrow$  In side a function,

for (i=1) { i only works here }

$\rightarrow$  A line where var made

Block Scope

{ it will work only here }

After that every where in that function.

If var made here.

## # Math Class

Ex -  $x = 2$   
 $y = 4$

1) Math.min(x, y)  $\rightarrow$  It will print the minimum number  
 $\Rightarrow 2 \Rightarrow 2$

2) Math.max(x, y)

$\Rightarrow 4$

3) Math.sqrt(y)

$\Rightarrow \sqrt{4} \Rightarrow 2$

4) Math.pow(x, y)

$\Rightarrow 2^4$

5) Math.avg(x, y)

$\therefore \frac{2+4}{2} = 3$

6) Math.abs(a)  $\rightarrow$

$\hookrightarrow$  If a is non negative a is returned;

$\hookrightarrow$  If a is negative the negation of the argument returned

$\hookrightarrow$  If +0, -0  $\rightarrow$  +0 returned.

$\hookrightarrow$  If  $\infty \rightarrow +\infty$  returned.

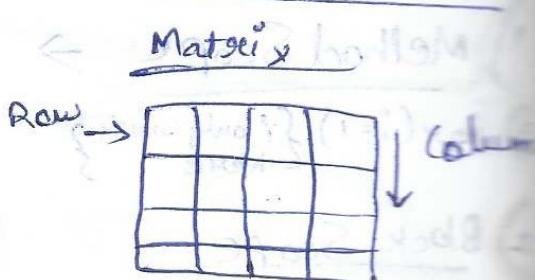

## # Advanced Patterns

1) 
$$\begin{matrix} * & 2 & 3 & 4 & 5 \\ * & * & * & * & * \\ * & & * & 2 & \\ * & & * & * & 3 \\ * & * & * & * & * & 4 \end{matrix}$$

boundary

new  $\rightarrow 1, 4$

Column  $\rightarrow 1, 5$

1) total no. of lines = Rows

Loop outer (1 to 4)

5x5

Q. Print (\*) if row = 1 or 4,

rectangle

Print (/\*\*) if column = 1 or 5,

Print (" ") if not any condition.
